Topics on Machine Learning

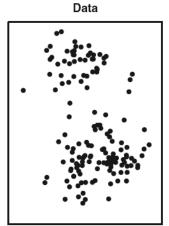

ECE 301 Linear Systems

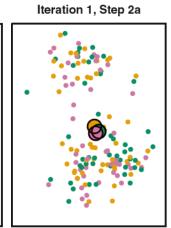

Chau-Wai Wong, NC State University, Spring 2021

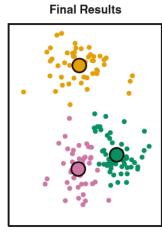

Machine Learning: An Introduction

(James, Witten, Hastie, & Tibshirani, 2013)

- Unsupervised learning:
 - → Learns from a set of unlabeled data to discover patterns, without human supervision.
 - ★ We'll cover principal component analysis (PCA).

- ◆ Supervised learning:
 - → Learns an input—output mapping based on labeled data.
 - We'll cover linear regression and neural networks.

Strawberry Bathing cap

(Li and Russakovsky, 2013)

Machine Learning Topics and Learning Objectives

- ◆ Topic I: Linear algebra
 - ★ Explain linear algebra concepts such as linear independence, vector space, and orthogonal basis
 - → Conduct eigendecomposition for symmetric matrices using Matlab
- Topic 2: Principal component analysis (unsupervised learning)
 - ★ Explain the two equivalent goals of PCA
 - → Implement the PCA algorithm and visualize the results
- Topic 3: Linear regression and prediction (supervised learning)
 - → Interpret regression problem mathematically and geometrically
 - → Apply linear regression to learning problems without overfit
- ◆ Topic 4: Convolutional neural network (CNN)
 - → Describe the structure of CNN
 - → Build and train simple CNNs using a deep learning package

Linear Algebra

Learning objectives

- Explain linear algebra concepts such as linear independence, vector space, and orthogonal basis
- Conduct eigendecomposition for symmetric matrices using Matlab
 (Refer to ECE 220's textbook for a review on vector and matrix. A comprehensive treatment of linear algebra can be found in Scheffe's appendices, available on the library's course reserves.)

Linear Algebra Review: Vector

- Vector: an <u>ordered</u> n-tuple.

Row vector:
$$\mathbf{x} = \begin{bmatrix} x_1, & x_2, & \dots, & x_n \end{bmatrix}$$

Column vector: $\mathbf{x} = \begin{bmatrix} x_1, & x_2, & \dots, & x_n \end{bmatrix}^T$
(Assume all vectors are column from now on.)

- Vector properties:

$$\mathbf{x} + \mathbf{y} = \mathbf{y} + \mathbf{x}$$
 (commutative)
 $\mathbf{x} + (\mathbf{y} + \mathbf{z}) = (\mathbf{x} + \mathbf{y}) + \mathbf{z}$ (associative)
 $c[x_1, \dots, x_n] = [cx_1, \dots, cx_n]$ (scaling)

- Norm/length: $||\mathbf{x}|| = (\mathbf{x}^T \mathbf{x})^{\frac{1}{2}}$, e.g., $\mathbf{x} = \begin{bmatrix} 3, 4 \end{bmatrix}^T$, $||\mathbf{x}|| = 5$.

Linear Algebra Review: Vector (cont'd)

- Inner product of x and y:

$$\mathbf{x}^T \mathbf{y} = [x_1, \cdots, x_n] \begin{bmatrix} y_1 \\ \vdots \\ y_n \end{bmatrix} = \sum_{i=1}^n x_i y_i = \mathbf{y}^T \mathbf{x}.$$

-
$$\mathbf{x}^T \mathbf{y} = ||\mathbf{x}|| \cdot ||\mathbf{y}|| \cos \theta_{\mathbf{x}, \mathbf{y}}$$

$$\mathbf{x}^{T}\mathbf{y} = ||\mathbf{x}|| \cdot ||\mathbf{y}|| \cos \theta_{\mathbf{x}, \mathbf{y}}$$

$$\mathbf{Ex: x} = [1, 0], \mathbf{y} = [1, 1]$$

$$\cos \theta_{\mathbf{x}, \mathbf{y}} = \frac{\mathbf{x}^{T}\mathbf{y}}{||\mathbf{x}|| ||\mathbf{y}||} = \frac{1 \cdot 1 + 0 \cdot 1}{\sqrt{1^{2} + 0^{2}} \cdot \sqrt{1^{2} + 1^{2}}} = \frac{\sqrt{2}}{2}$$

$$\Rightarrow \theta_{\mathbf{x}, \mathbf{y}} = 45^{\circ}$$

- Def: **x** and **y** are orthogonal if $\mathbf{x}^T \mathbf{y} = 0$.
- Remark: When $\mathbf{x}^T \mathbf{y} = 0$, $\cos^{-1} \left(\frac{0}{||\mathbf{x}|| ||\mathbf{y}||} \right) = \frac{k\pi}{2}$.

Linear Algebra Review: Matrix

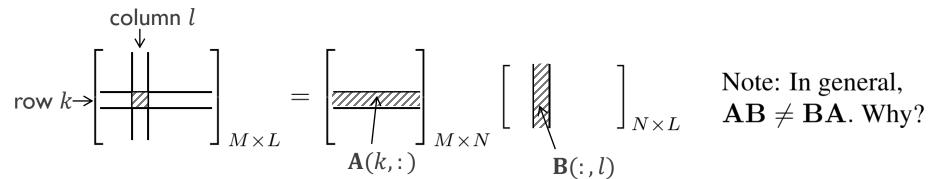

- Matrix:
$$\mathbf{A} = [a_{kl}] = \begin{bmatrix} a_{11} & \cdots & a_{1N} \\ a_{21} & \cdots & a_{2N} \\ \vdots & \ddots & \vdots \\ a_{M1} & \cdots & a_{MN} \end{bmatrix} \in \mathbb{R}^{M \times N}, M \text{ rows, } N \text{ columns.}$$

- Addition: $\mathbf{A} + \mathbf{B} = [a_{kl} + b_{kl}] = \mathbf{B} + \mathbf{A}$
- Scaling: $c\mathbf{A} = \begin{bmatrix} ca_{kl} \end{bmatrix}$ Ex: $2 \begin{bmatrix} 0 & 1 \\ 2 & 3 \end{bmatrix} \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 1 & 2 \end{bmatrix}$
- Transpose "T": $\mathbf{A}^T = [a_{kl}]^T = [a_{lk}]$ Ex: $\begin{bmatrix} 1 & -1 & 1 \\ 2 & 4 & 6 \end{bmatrix} = \begin{bmatrix} 1 & 2 \\ -1 & 4 \\ 1 & 6 \end{bmatrix}$
- Special matrices: $\mathbf{0}_{M\times N} = [0]_{M\times N}, \ \mathbb{1}_{M\times N} = [1]_{M\times N},$

$$\mathbf{I}_M = egin{bmatrix} 1 & \dots & 0 \ dots & \ddots & dots \ 0 & \dots & 1 \end{bmatrix} = \mathrm{diag}(\mathrm{ones}(M,1)).$$

Linear Algebra Review: Matrix (cont'd)

- Matrix Multiplication: $\mathbf{C} = \mathbf{AB}$, where $c_{kl} = \sum_{q=1}^{N} a_{kq} b_{ql} = \mathbf{A}(k,:)\mathbf{B}(:,l)$

Ex:
$$\begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} 3 & 4 \\ 5 & 6 \end{bmatrix} = \begin{bmatrix} 3+5 & 4+6 \\ -3+5 & -4+6 \end{bmatrix} = \begin{bmatrix} 8 & 10 \\ 2 & 2 \end{bmatrix}$$

- Def: $A^{-1} = B$ if ① A is square, and ② AB = I = BA.

Linear Algebra Review: Matrix (cont'd)

- For 2-by-2 matrices:
$$\mathbf{A}^{-1} = \begin{bmatrix} a & b \\ c & d \end{bmatrix}^{-1} = \frac{1}{\det \mathbf{A}} \begin{bmatrix} d & -c \\ -b & a \end{bmatrix}^T = \frac{1}{ad-bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$

Ex:
$$\mathbf{A}\mathbf{x} = \mathbf{b}$$
, $\mathbf{A} = \begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix}$, $\mathbf{b} = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$.

$$\mathbf{A}^{-1}(\mathbf{A}\mathbf{x}) = \mathbf{A}^{-1}\mathbf{b} \Longrightarrow \mathbf{x} = \mathbf{A}^{-1}\mathbf{b} = \frac{1}{2} \begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \end{bmatrix} = \begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \end{bmatrix}$$

Motivation: Linear Algebra for Discrete Convolution

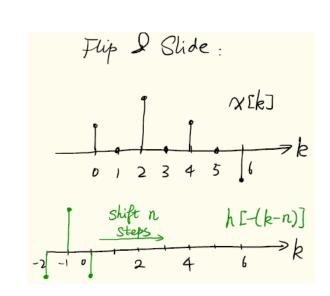

Ex:
$$x[n] = \{1, 0, 2, 0, 1, 0, -1\}, \ h[n] = \{-1, 2, -1\}. \ y[n] = x[n] * h[n] = ?$$

$$x[0] \quad \text{length} = 7 \quad h[0] \text{ length} = 3 \quad \text{length} = ?$$

Matrix-vector form:

$$\begin{bmatrix} -1\\2\\-3\\4\\-3\\2\\0\\-2\\1 \end{bmatrix} = \begin{bmatrix} -1&&\cdots&&&0\\2&-1&&&&\\&-1&2&-1&&&\\&&&-1&2&-1&&\\&&&&&-1&2&-1\\&&&&&&-1&2\\0&&&&&&&-1 \end{bmatrix} \begin{bmatrix} 1\\0\\2\\0\\1\\0\\-1 \end{bmatrix}$$

$$\mathbf{H} \in \mathbb{R}^{9 \times 7} \qquad \mathbf{x} \in \mathbb{R}^{7}$$

Linear Independence of a Set of Vectors

- Def: Given $\{\mathbf v_1,\dots,\mathbf v_n\}$. For $\alpha_1\mathbf v_1+\dots+\alpha_n\mathbf v_n=\mathbf 0$, If $\alpha_i=0, \forall i$, then "linearly independent;" If not all $\alpha_i=0$, then "linearly dependent."
- lacktriangle For "linearly dependent" case (when $\alpha_1 \neq 0$), we may write:

$$\mathbf{v}_1 = \beta_2 \mathbf{v}_2 + \dots + \beta_n \mathbf{v}_n$$
 Why?

• Ex: $\mathbf{v}_1 = \begin{bmatrix} 1 & 2 & 1 \end{bmatrix}^T$, $\mathbf{v}_2 = \begin{bmatrix} 1 & 0 & 1 \end{bmatrix}^T$.

$$\alpha_1 \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} + \alpha_2 \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} = \mathbf{0} \qquad \Rightarrow \begin{cases} \begin{array}{c} \alpha_1 + \alpha_2 = 0 \\ 2\alpha_1 + 0 = 0 \\ \alpha_1 + \alpha_2 = 0 \end{array} \Rightarrow \begin{cases} \begin{array}{c} \alpha_1 = 0 \\ \alpha_2 = 0 \end{array} \Rightarrow \text{linearly independent} \end{cases}$$

Linear Independence of a Set of Vectors (cont'd)

• Ex: $\mathbf{v}_1 = \begin{bmatrix} 1 & 2 & 1 \end{bmatrix}^T$, $\mathbf{v}_4 = \begin{bmatrix} -2 & -4 & -2 \end{bmatrix}^T$.

 $\mathbf{v}_4 = -2\mathbf{v}_1 \Rightarrow \text{linearly dependent}$

• Ex: $\mathbf{v}_1 = \begin{bmatrix} 1 & 2 & 1 \end{bmatrix}^T$, $\mathbf{v}_2 = \begin{bmatrix} 1 & 0 & 1 \end{bmatrix}^T$, $\mathbf{v}_3 = \begin{bmatrix} 0 & 1 & 0 \end{bmatrix}^T$.

 $\mathbf{v}_1 = \mathbf{v}_2 + 2\mathbf{v}_3 \Rightarrow \text{linearly dependent}$

Vector Space

♦ Def: Vector space: A set, V, of all vectors that are linear combination of $\{\mathbf{v}_i\}_{i=1}^n$, i.e.,

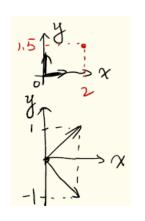

$$V = \left\{ \mathbf{v} = \sum_{i=1}^{n} \alpha_i \mathbf{v}_i, \ \alpha_i \in \mathbb{R} \right\}.$$

 \mathbf{v}_i 's are said to span the vector space, i.e., $V = \operatorname{span}\{\mathbf{v}_i, \dots, \mathbf{v}_n\}$.

♦ Ex:

$$V^{(1)} = \left\{ \alpha_1 \begin{bmatrix} 1 \\ 0 \end{bmatrix} + \alpha_2 \begin{bmatrix} 0 \\ 1 \end{bmatrix}, \ \alpha_i \in \mathbb{R} \right\}$$

$$V^{(2)} = \left\{ r_1 \begin{bmatrix} 1 \\ 1 \end{bmatrix} + r_2 \begin{bmatrix} 1 \\ -1 \end{bmatrix}, r_i \in \mathbb{R} \right\}$$

Basis for Vector Space

- lacktriangle Def: A <u>basis</u> for V is a set of <u>linearly independent</u> vectors that span V.
- **♦** Ex:

$$\left\{ \begin{bmatrix} 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ -1 \end{bmatrix} \right\} \text{ yes } \left\{ \begin{bmatrix} 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \end{bmatrix} \right\} \text{ yes } \left\{ \begin{bmatrix} 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \end{bmatrix} \right\} \text{ no }$$

Dimension of Vector Space

- lacktriangle Def: The <u>dimension</u> of vector space V is the number of vectors in any/a basis of V.
- Column/row rank: The dimension of column/row vector space, respectively.
- Ex: What's the column rank of matrix

$$\mathbf{X} = \begin{bmatrix} 1 & 1 & 0 \\ 2 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix}?$$

It's just another way to ask: what's the dimension of vector space

$$V = \left\{ \mathbf{v} = \alpha_1 \middle| \begin{array}{c} 1 \\ 2 \\ 1 \end{array} \middle| + \alpha_2 \middle| \begin{array}{c} 1 \\ 0 \\ 1 \end{array} \middle| + \alpha_3 \middle| \begin{array}{c} 0 \\ 1 \\ 0 \end{array} \middle|, \ \alpha_i \in \mathbb{R} \right\}?$$

Dimension of Vector Space (cont'd)

◆ Approach I: By observation, we notice that any two pairs of vectors spanned *V* are linearly independent. Hence, we can immediate write out at least three bases:

$$\left\{ \begin{bmatrix} 1\\2\\1 \end{bmatrix}, \begin{bmatrix} 1\\0\\1 \end{bmatrix} \right\} \quad \text{or} \quad \left\{ \begin{bmatrix} 1\\2\\1 \end{bmatrix}, \begin{bmatrix} 0\\1\\0 \end{bmatrix} \right\} \quad \text{or} \quad \left\{ \begin{bmatrix} 1\\0\\1 \end{bmatrix}, \begin{bmatrix} 0\\1\\0 \end{bmatrix} \right\}$$

Hence, the column rank of X or dimension of vector space V is 2.

lacktriangle Approach 2: Define the three vectors to be v_1, v_2, v_3 , respectively.

$$V = \left\{ \mathbf{v} = \alpha_1(\mathbf{v}_2 + 2\mathbf{v}_3) + \alpha_2\mathbf{v}_2 + \alpha_3\mathbf{v}_3 \right\}$$
$$= \left\{ \mathbf{v} = (\alpha_1 + \alpha_2)\mathbf{v}_2 + (2\alpha_1 + \alpha_3)\mathbf{v}_3 \right\}.$$

 $\mathbf{v}_2 \perp \mathbf{v}_3 \Rightarrow$ they are linearly independent. So the dim/rank is 2.

Projection of a Vector on a Unit Vector

- ◆ Project a vector **x** on a unit vector **u**:
 - + Projection length is $\mathbf{u}^T \mathbf{x}$. (a number, with sign)
 - + Projected vector is $(\mathbf{u}^T \mathbf{x})\mathbf{u}$. (a scaled vector along \mathbf{u})
- Proof (projection length):

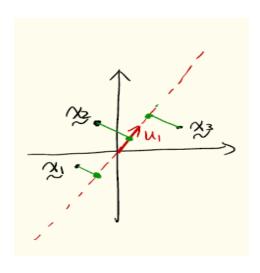

$$\mathbf{x}^{T}\mathbf{y} = \|\mathbf{x}\| \|\mathbf{y}\| \cos \theta, \quad \text{let } \mathbf{u} = \mathbf{y}/\|\mathbf{y}\|.$$

$$\mathbf{x}^T \left(\frac{\mathbf{y}}{\|\mathbf{y}\|} \right) = \|\mathbf{x}\| \cos \theta = \mathbf{u}^T \mathbf{x}.$$

Projection of a Vector on a Unit Vector

◆ Example:

$$\mathbf{u}_{1} = \begin{bmatrix} \frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2} \end{bmatrix}^{T}$$

$$\mathbf{x}_{1} = \begin{bmatrix} -1, -\frac{1}{2} \end{bmatrix}^{T}$$

$$\mathbf{x}_{2} = \begin{bmatrix} -\frac{1}{2}, 1 \end{bmatrix}^{T}$$

$$\mathbf{x}_{3} = \begin{bmatrix} 2, 1 \end{bmatrix}^{T}$$

$$\mathbf{z}_{11} = \mathbf{u}_{1}^{T} \mathbf{x}_{1} = \frac{\sqrt{2}}{2} \cdot \left(-\frac{3}{2} \right)$$

$$\mathbf{z}_{21} = \frac{\sqrt{2}}{4}$$

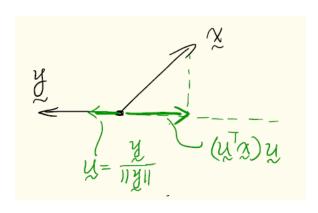

$$\mathbf{z}_{31} = \frac{3}{2}\sqrt{2}$$

Projection One Vector on Another

- ◆ Project a vector **x** on a vector **y**:
 - + Projection length is $y^T x/||y||$. (a number, with sign)
 - + Projected vector is $(y^Tx)y/||y||^2$. (a scaled vector along y)
- Proof (projected vector):

Projection of \mathbf{x} onto $\mathbf{y} = (\mathbf{u}^T \mathbf{x}) \mathbf{u}$

$$= \left[\left(\frac{\mathbf{y}}{\|\mathbf{y}\|} \right)^T \mathbf{x} \right] \frac{\mathbf{y}}{\|\mathbf{y}\|} = \left(\mathbf{y}^T \mathbf{x} \right) \mathbf{y} / \left\| \mathbf{y} \right\|^2.$$

Orthonormal Basis

- lacktriangle Def: A basis $\{a_1, \ldots, a_r\}$ for V is called orthonormal if r vectors are pairwise orthogonal and have unit norm.
- ◆ Ex: Given a vector space

$$V = \left\{ \mathbf{v} = \alpha_1 \middle| \begin{array}{c|c} 1 \\ 2 \\ 1 \end{array} \middle| + \alpha_2 \middle| \begin{array}{c|c} 1 \\ 0 \\ 1 \end{array} \middle| + \alpha_3 \middle| \begin{array}{c|c} 0 \\ 1 \\ 0 \end{array} \middle|, \ \alpha_i \in \mathbb{R} \right\}$$

$$\left\{ \begin{bmatrix} 1\\2\\1 \end{bmatrix}, \begin{bmatrix} 1\\0\\1 \end{bmatrix} \right\} \qquad \left\{ \begin{bmatrix} 1\\2\\1 \end{bmatrix}, \begin{bmatrix} 0\\1\\0 \end{bmatrix} \right\} \qquad \left\{ \begin{bmatrix} 1\\0\\1 \end{bmatrix}, \begin{bmatrix} 0\\1\\0 \end{bmatrix} \right\}$$

Basis, but Basis, but nonorthonormal. nonorthonormal.

$$\left\{ \begin{bmatrix} 1\\0\\1 \end{bmatrix}, \begin{bmatrix} 0\\1\\0 \end{bmatrix} \right\}$$

Basis w/ orthogonal vectors. Can normalize $[1 \ 0 \ 1]^T$ to obtain an orthonormal basis.

$$\left\{ \begin{bmatrix} 1\\0\\1 \end{bmatrix}, \begin{bmatrix} 0\\1\\0 \end{bmatrix}, \begin{bmatrix} 1\\2\\1 \end{bmatrix} \right\}$$

Not even a basis. Why???

Orthogonal Matrix

- Def: A square matrix P is orthogonal if and only if its columns (or rows) constitute an orthonormal basis.
- Properties:

$$+$$
 $\mathbf{P}^{\mathrm{T}}\mathbf{P} = \mathbf{P}\mathbf{P}^{\mathrm{T}} = \mathbf{I}$

$$+$$
 $\mathbf{P}^{-1} = \mathbf{P}^{\mathrm{T}}$

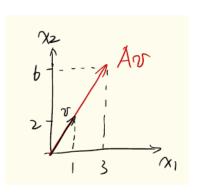

$$\mathbf{P}^T \mathbf{P} = \begin{bmatrix} -\mathbf{v}_1^T \\ -\mathbf{v}_2^T \\ -\mathbf{v}_3^T \end{bmatrix} \begin{bmatrix} \mathbf{v}_1 & \mathbf{v}_2 & \mathbf{v}_3 \\ \vdots & \vdots & \vdots \end{bmatrix} = \begin{bmatrix} \mathbf{v}_1^T \mathbf{v}_1 & 0 & 0 \\ 0 & \mathbf{v}_2^T \mathbf{v}_2 & 0 \\ 0 & 0 & \mathbf{v}_3^T \mathbf{v}_3 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \mathbf{I}$$

$$\mathbf{P}\mathbf{P}^{T} = \begin{bmatrix} 0 + \left(\frac{1}{\sqrt{2}}\right)^{2} + \left(\frac{1}{\sqrt{2}}\right)^{2} & 0 & \frac{1}{2} - \frac{1}{2} \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \mathbf{I} \quad \text{(Direct evaluation)}$$

Eigenvector and Eigenvalue

- Def: Let A be an n-by-n matrix. A nonzero vector v is called an eigenvector of A if $Av = \lambda v$. Here, λ is called a eigenvalue of A and v is eigenvector corresponding to eigenvalue λ .
- Prefix "eigen" means "characteristic."
- lacktriangle Physical interpretation: Operator A is invariant to v, which means that A acts on v can only change its length but not the direction.
- **E**X:

Let
$$\mathbf{A} = \begin{bmatrix} 3 & 0 \\ 8 & -1 \end{bmatrix}$$
, $\mathbf{v} = \begin{bmatrix} 1 \\ 2 \end{bmatrix}$.
Since $\mathbf{A}\mathbf{v} = \begin{bmatrix} 3 \cdot 1 + 0 \cdot 2 \\ 8 \cdot 1 - 1 \cdot 2 \end{bmatrix} = \begin{bmatrix} 3 \\ 6 \end{bmatrix} = 3\mathbf{v}$, the eigenvalue $\lambda = 3$.

Eigendecomposition for Symmetric Matrices

- Def: A square matrix A is symmetric if $A = A^T$.
- lacktriangle Thm: A p-by-p symmetric matrix **R** can be diagonalized by an orthogonal matrix $V = [v_1, ..., v_p]$. The following statements are equivalent:
- 1. $\mathbf{R} = \mathbf{V} \mathbf{\Lambda} \mathbf{V}^T$

1.
$$\mathbf{R} = \mathbf{V}\Lambda\mathbf{V}^T$$

$$= \begin{bmatrix} \mathbf{v}_1 & \cdots & \mathbf{v}_p \end{bmatrix} \begin{bmatrix} \lambda_1 & \cdots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \cdots & \lambda_p \end{bmatrix} \begin{bmatrix} \lambda_1 & \cdots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \cdots & \lambda_p \end{bmatrix} \begin{bmatrix} \mathbf{v}_1^T \\ -\frac{\mathbf{v}_1^T}{\mathbf{v}_p} \end{bmatrix}$$
3. $\mathbf{R}\mathbf{v}_i = \lambda_i \mathbf{v}_i, \quad i = 1, \dots, p.$

2.
$$\mathbf{RV} = \mathbf{V}\boldsymbol{\Lambda} = [\mathbf{v}_1 \cdots \mathbf{v}_p] \begin{bmatrix} \vdots & \ddots & \vdots \\ 0 & \cdots & \lambda_p \end{bmatrix}$$

3.
$$\mathbf{R}\mathbf{v}_i = \lambda_i \mathbf{v}_i, \quad i = 1, \dots, p$$

$$egin{aligned} &= \left[\lambda_1 \mathbf{v}_1 \cdots \lambda_p \mathbf{v}_p
ight] egin{bmatrix} \mathbf{v}_1^T \ dots \ \mathbf{v}_p^T \end{bmatrix} \ &= \sum_{i=1}^p \lambda_i \mathbf{v}_i \mathbf{v}_i^T \end{aligned}$$

Eigendecomposition Using Matlab_

- Ex: Use Matlab to decompose matrix $\mathbf{A} = \begin{bmatrix} 1 & 4 & 5 \\ 4 & -3 & 0 \\ 5 & 0 & 7 \end{bmatrix}$
- Source code:

```
A = [1 \ 4 \ 5; \ 4 \ -3 \ 0; \ 5 \ 0 \ 7];
[V, D] = eig(A); % use built-in function for eigendecomposition
for j = 1 : size(D, 1)
  if norm(A * V(:, j) - D(j, j) * V(:, j)) < 1e-5 % verify result
    disp(['Eigenvector-value pair ' int2str(j) ' verified.'])
  end
                                     Can you numerically verify the 3 equivalent
end
```

Output:

D =0.5952 0.6072 0.5263 -6.0892 -0.7707 0.6167 0.1601 0.9383 -0.2274 -0.5009 0.8351 10.1509

expressions on the previous slide?

Eigendecomposition by Hand (optional)

 \bullet Thm: Eigenvalues are roots of the *characteristic polynomial* $\det(\mathbf{A} - \lambda \mathbf{I})$.

• Ex:
$$\mathbf{A} = \begin{bmatrix} 5 & 4 \\ 1 & 2 \end{bmatrix}$$

$$0 = \det \left(\begin{bmatrix} 5 & 4 \\ 1 & 2 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) = \det \left(\begin{bmatrix} 5 - \lambda & 4 \\ 1 & 2 - \lambda \end{bmatrix} \right)$$
$$= \lambda^2 - 7\lambda + 6 \Rightarrow \lambda_1 = 6, \ \lambda_2 = 1.$$

For
$$\lambda_1 = 6$$
, $(\mathbf{A} - \lambda_1 \mathbf{I}) \mathbf{v} = 0 \Leftrightarrow \left\{ \begin{array}{l} -\mathbf{v}_1 + 4\mathbf{v}_2 = 0 \\ \mathbf{v}_1 - 4\mathbf{v}_2 = 0 \end{array} \right. \Rightarrow \mathbf{v} = \left[\begin{array}{l} 4 \\ 1 \end{array} \right]$ Nonunique solutions for underdetermined systems $\lambda_2 = 1$, $(\mathbf{A} - \lambda_2 \mathbf{I}) \mathbf{v} = 0 \Leftrightarrow \left\{ \begin{array}{l} 4\mathbf{v}_1 + 4\mathbf{v}_2 = 0 \\ \mathbf{v}_1 + 4\mathbf{v}_2 = 0 \end{array} \right. \Rightarrow \mathbf{v} = \left[\begin{array}{l} 1 \\ -1 \end{array} \right]$ Systems

Principal Component Analysis (Unsupervised Learning)

Learning objectives

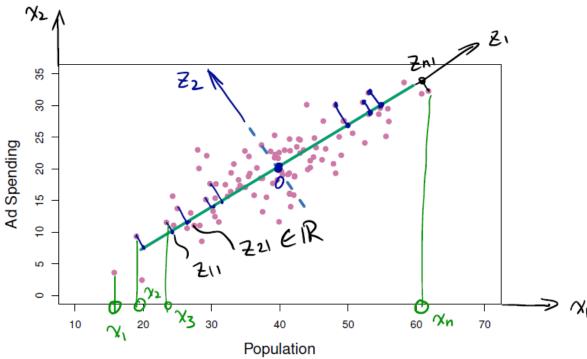

- Explain the two equivalent goals of PCA
- o Implement the PCA algorithm and visualize the results (Ref: 10.2 of James et al. 2013, 12.2 of Murphy 2012. Extra ref: 12.1 of Bishop 2006.)

Unsupervised Learning

- ◆ Def: Learns from a set of unlabeled data to discover interesting patterns.
 - → Visualize the data in an informative way.
 - → Discover subgroups among observations/variables.
- **♦** Examples:
 - + Movies grouped by ratings and behavioral data from viewers.
 - + Groups of shoppers characterized by browsing & purchasing histories.
 - → Subgroups of breast cancer patients grouped by gene expressions.
 - → Tweets grouped by latent topics inferred from the use of words.

PCA: Two Equivalent Goals

Goals, i.e., cost/loss/objective functions, of PCA:
 (1) maximize variance, and (2) minimize error.

PCA Objective I: Maximizing Variance

- ◆ Maximize variance: Project data onto a lower-dimensional subspace while maximizing the variance of the projected data.
- Details:

$$\{\mathbf{x}_i\}_{i=1}^n, \quad \mathbf{x}_i \in \mathbb{R}^p$$

$$\mathbf{u}_1 : \left\| \mathbf{u}_1 \right\|^2 = 1$$

Unit vector

$$z_{i1} = \mathbf{u}_1^T \mathbf{x}_i$$

Projection of \mathbf{x}_i along direction \mathbf{u}_1

- ◆ Naming:
 - $+ z_{i1}$ —score, coefficient, transformed coefficient, weight, projected values, ...
 - $+ u_1$ —loading, (Ist) principal component vector, ...

NC STATE UNIVERSITY

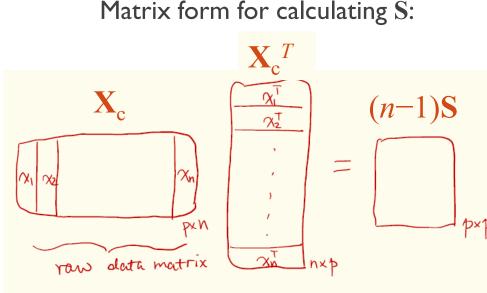

Spread
$$=$$
 $\frac{1}{n-1}\sum_{i=1}^n \left(z_{i1}-\overline{z_1}\right)^2$: where $\overline{z_1}\stackrel{\text{def}}{=}\frac{1}{n}\sum_{i=1}^n z_{i1}$ is the sample mean.

Sample variance measures spread of the projected data along \mathbf{u}_1 .

$$= \frac{1}{n-1} \sum_{i=1}^{n} \left(\mathbf{u}_{1}^{T} \mathbf{x}_{i} - \mathbf{u}_{1}^{T} \bar{\mathbf{x}} \right)^{2}$$

$$= \frac{1}{n-1} \sum_{i=1}^{n} \mathbf{u}_{1}^{T} \left(\mathbf{x}_{i} - \bar{\mathbf{x}} \right) \left(\mathbf{x}_{i} - \bar{\mathbf{x}} \right)^{T} \mathbf{u}_{1}$$

$$= \mathbf{u}_{1}^{T} \left[\frac{1}{n-1} \sum_{i=1}^{n} \left(\mathbf{x}_{i} - \bar{\mathbf{x}} \right) \left(\mathbf{x}_{i} - \bar{\mathbf{x}} \right)^{T} \right] \mathbf{u}_{1}$$
S, sample covariance

(Assuming all \mathbf{x}_i are already centered, i.e., $\mathbf{x}_i \leftarrow \mathbf{x}_i - \overline{\mathbf{x}}, \ \forall i$.)

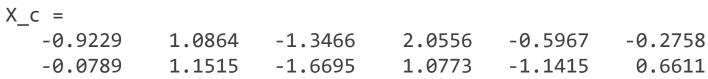

NC STATE UNIVERSITY

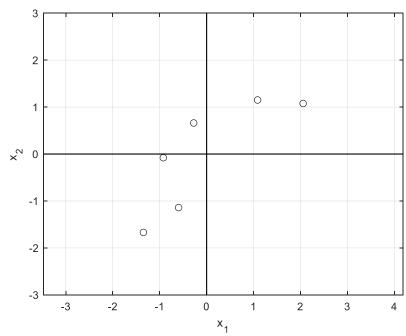

Source code:

```
plot(X_c(1, :), X_c(2, :), 'ko');
xlabel('x_1'); ylabel('x_2');
axis([-3 3 -3 3]); axis equal;
hold on;
```

$$S = (X_c * X_c') / (n-1);$$

Output:

maximize_u
$$\mathbf{u}^T \mathbf{S} \mathbf{u}$$
 subject to $\|\mathbf{u}\| = 1$

Use Lagrange, we have $J(\mathbf{u}) = \mathbf{u}^T \mathbf{S} \mathbf{u} + \lambda \left(1 - \mathbf{u}^T \mathbf{u}\right)$. Taking the gradient $\nabla_{\mathbf{u}}$ (i.e., a vector of partial derivatives, $\left[\frac{\partial}{\partial u_1}, \dots, \frac{\partial}{\partial u_n}\right]^T$) for $J(\mathbf{u})$ and set it to the **0** vector

$$\nabla_{\mathbf{u}} J(\mathbf{u}) = 2\mathbf{S}^T \mathbf{u} + \lambda(-2\mathbf{u}) = \begin{vmatrix} \mathbf{0}, \\ \mathbf{u} = \hat{\mathbf{u}} \end{vmatrix}$$

we obtain $\mathbf{S}\hat{\mathbf{u}} = \lambda \hat{\mathbf{u}}$. Left multiply $\hat{\mathbf{u}}^T$ to both sides, we have

$$\hat{\mathbf{u}}^T \mathbf{S} \hat{\mathbf{u}} = \hat{\mathbf{u}}^T \lambda \hat{\mathbf{u}} = \lambda \|\hat{\mathbf{u}}\|^2 = \lambda.$$

The cost function is then simplified to finding the largest λ , or largest eigenvalue of S. $\hat{\mathbf{u}}$ is the eigenvector which corresponds to the largest eigenvalue.

PCA: Forward Transform and Reconstruction

Analysis/Transform:

Also known as Karhunen-Loeve Transform (KLT)

$$\begin{bmatrix} z_{i1} \\ z_{i2} \\ \vdots \\ z_{in} \end{bmatrix} = \begin{bmatrix} ---\frac{\mathbf{u}_1^T}{\mathbf{u}_2^T} - -- \\ ----\frac{\mathbf{v}_2^T}{\mathbf{u}_n^T} - -- \\ \vdots \\ \mathbf{u}_n^T \end{bmatrix} \begin{bmatrix} \mathbf{x}_i \end{bmatrix}$$

$$\mathbf{z}_i = \mathbf{U}^T \mathbf{x}_i$$

Synthesis/Reconstruction:

$$\mathbf{x}_i = \mathbf{U}\mathbf{z}_i = \begin{bmatrix} \mathbf{u}_1^{\dagger} & \cdots & \mathbf{u}_n^{\dagger} \end{bmatrix} \begin{bmatrix} z_{i1} \\ \vdots \\ z_{in} \end{bmatrix} = \sum_{k=1}^{n} z_{ik} \mathbf{u}_k$$

$$= \begin{bmatrix} 1.19 \\ 1.04 \end{bmatrix} + \begin{bmatrix} -0.09 \\ 0.11 \end{bmatrix}$$
Contribution from PC2 is small

Analysis example:

$$\underbrace{\begin{bmatrix} -1.58 \\ -0.14 \end{bmatrix}}_{\mathbf{z}_{i}} = \underbrace{\begin{bmatrix} -0.75 & 0.66 \\ -0.66 & -0.75 \end{bmatrix}}_{\mathbf{U}^{\mathbf{T}}} \underbrace{\begin{bmatrix} 1.09 \\ 1.15 \end{bmatrix}}_{\mathbf{x}_{i}}$$

Synthesis example:

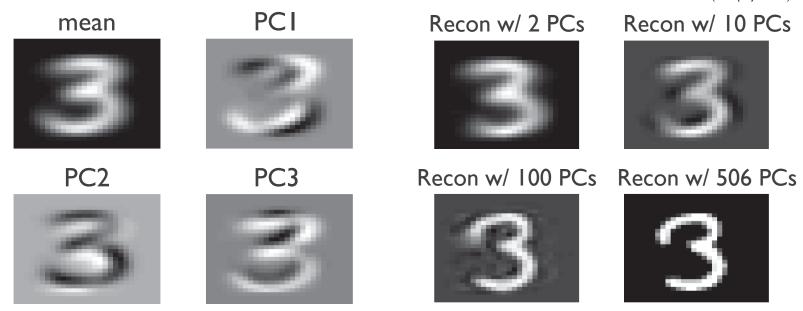

$$\underbrace{\begin{bmatrix} 1.09 \\ 1.15 \end{bmatrix}}_{\mathbf{x}_{i}} = \underbrace{\begin{bmatrix} -0.75 & 0.66 \\ -0.66 & -0.75 \end{bmatrix}}_{\mathbf{U}} \underbrace{\begin{bmatrix} -1.58 \\ -0.14 \end{bmatrix}}_{\mathbf{z}_{i}}$$

$$= -1.58 \begin{bmatrix} -0.75 \\ -0.66 \end{bmatrix} - 0.14 \begin{bmatrix} 0.66 \\ -0.75 \end{bmatrix}$$

$$= \begin{bmatrix} 1.19 \\ 1.04 \end{bmatrix} + \begin{bmatrix} -0.09 \\ 0.11 \end{bmatrix}$$
Contribution for PC2 is small

Reconstruction Using Dominant PCs

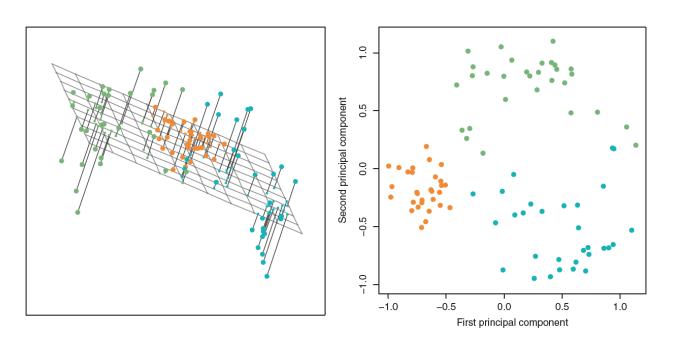

(Murphy 2012)

- Each image of 50x50 is stacked into a column vector of length 2,500.
- Sample covariance matrix will be of size 2,500x2,500.
- Eigenvectors of length 2,500 are <u>reshaped</u> to 50x50 for display. May call them "eigen-images."

PCA Objective 2: Minimizing Error

◆ Approximate the data points using a presentation in a lower-dimensional subspace.

NC STATE UNIVERSITY

Assume \mathbf{x}_i 's are centered, i.e., $\mathbf{x}_i \leftarrow \mathbf{x}_i - \bar{\mathbf{x}}$, $\forall i$.

(Optional)

$$J(\mathbf{u}_{1}, z_{i1}) = \frac{1}{n} \sum_{i=1}^{n} \|\mathbf{x}_{i} - z_{i1}\mathbf{u}_{1}\|^{2} = \frac{1}{n} \sum_{i=1}^{n} (\mathbf{x}_{i} - z_{i1}\mathbf{u}_{1})^{T} (\mathbf{x}_{i} - z_{i1}\mathbf{u}_{1})$$
$$= \frac{1}{n} \sum_{i=1}^{n} (\mathbf{x}_{i}^{T}\mathbf{x}_{i} - 2z_{i1}\mathbf{x}_{i}^{T}\mathbf{u}_{1} + z_{i1}^{2}\mathbf{u}_{1}^{T}\mathbf{u}_{1})$$

$$\frac{\partial}{\partial z_{j1}} J = \frac{1}{n} (-2\mathbf{x}_j^T \mathbf{u}_1 + 2z_{j1} \underbrace{\mathbf{u}_1^T \mathbf{u}_1}) = \begin{vmatrix} 0 \Rightarrow \hat{z}_{j1} = \mathbf{u}_1^T \mathbf{x}_j \\ z_{j1} = \hat{z}_{j1} \end{vmatrix}$$

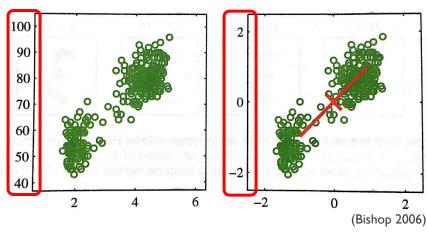

$$J = \frac{1}{n} \sum_{i=1}^{n} (\mathbf{x}_i^T \mathbf{x}_i - 2z_{i1}^2 + z_{i1}^2)$$
 (skip the hat of z_{i1} for simplicity)

$$\min_{\mathbf{u}_1} J = \max_{\mathbf{u}_1} \sum_{i=1}^{n} z_{i1}^2 = \underline{\text{maximize the spread!}}$$

Same as the Objective I

PCA's Caveat: Proper Standardization May be Needed

• If coordinates of $\mathbf{x}_i = [x_{i1}, ..., x_{ip}]^T$ have different units, maximal variance direction may be biased toward x_{ij} with largest magnitude.

- Why is standardization needed in this case?
- Do the hand-written digit and face recognition need standardization?

When proper standardization of coordinate/variable/feature is needed:

$$\tilde{x}_{ij} = \frac{x_{ij} - \bar{x}_j}{\sqrt{\frac{1}{n} \sum_{i=1}^n (x_{ij} - \bar{x}_j)^2}}, \quad j = 1, \dots, p.$$
 Standardize along the feature/*x*-direction rather than the *y*-direction of data matrix **X**.

Standardize along the feature/x-

PCA: Applications and Beyond

- PCA is lightweight yet powerful. Should be tried before applying more sophisticated tools.
- Modern replacement of PCA:
 - → Data visualization: t-SNE, UMAP.
 - → Dimensionality reduction: Nonlinear dimensionality reduction algorithms.
 - ★ Lossy data compression: Data-independent transforms tailored for data following certain statistical behaviors.
 - → Feature extraction: Topic modeling (unsupervised), CNN self-learned feature extraction (supervised).

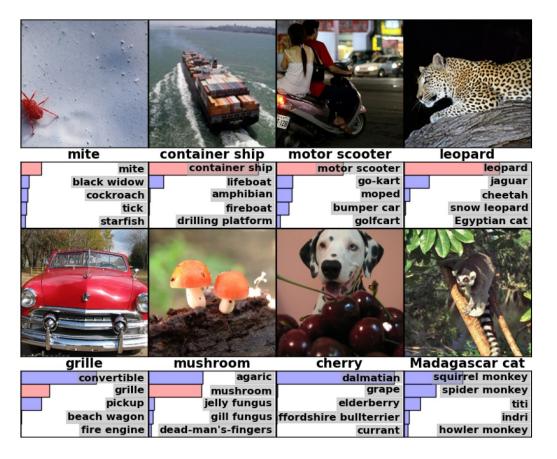

Linear Regression and Prediction (Supervised Learning)

Learning objectives

- Interpret regression problem mathematically and geometrically
- Apply linear regression to learning problems without overfit

(A comprehensive treatment of basic linear regression can be found in Scheffe Ch1, available on the library's course reserves.)

Supervised Learning: Classification

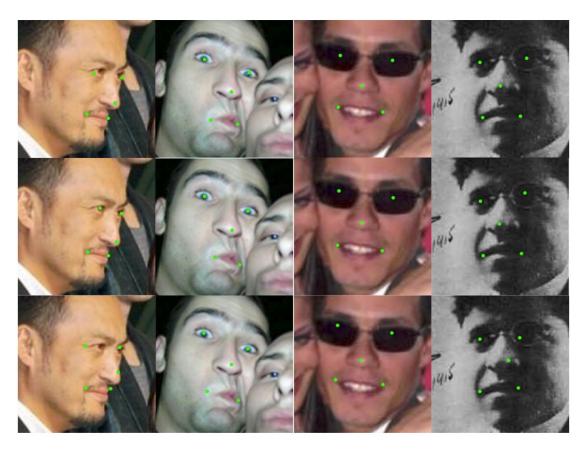

Goal of classification:
Assign a categorical/
qualitative label, or a
class, to an given input.

Given an image, it returns the class label.

Optionally, provide a "confidence score."

Supervised Learning: Regression

Goal of regression:

Assign a number to each input.

Loosely, ML people also call it "label."

← Given a facial image, it returns the 2D location for each key point of the face.

Supervised Learning: Definition

♦ Terminologies:

- igspace Training data: $\mathcal{D}_{\mathrm{tr}} = \{(\mathbf{x}_i, y_i)\}_{i=1}^n$
- igspace Test data: $\mathcal{D}_{\text{te}} = \{(\mathbf{x}_i, y_i)\}_{i=n+1}^{n+m}$
- + Learned model: $y = f(\mathbf{x})$
- Goal: Given a set of training data \mathcal{D}_{tr} as the inputs, we would like to compute a learned model $y = f(\mathbf{x})$ such that it can generate accurate predicted outputs

$$\hat{y}_i = f(\mathbf{x}_i), \quad i = n+1, \dots, n+m,$$

from a set of new inputs $\{\mathbf{x}_i\}_{i=n+1}^{n+m}$ of the test data \mathcal{D}_{te} whose labels $\{y_i\}_{i=n+1}^{n+m}$ have never been taken into account when the model is computed.

Quantifying the Accuracy of Prediction

- Quantify the accuracy of the learned model by a loss function (or cost/objective function), based on predicted output, \hat{y}_i , and the true output, y_i , namely, $L(\hat{y}, y)$.
- ◆ A typical choice for the loss function for a continuous-valued output is the *mean squared error*:

$$L(\hat{\mathbf{y}}, \mathbf{y}) = \frac{1}{m} \sum_{i=n+1}^{n+m} (\hat{y}_i - y_i)^2$$

Key ML assumption: Test data shouldn't have been seen before (at the training stage), or there will be overfit.

Simplest Example: Linear Model

$$\boldsymbol{\theta} = [\beta_0, \beta_1]^T$$
 is the parameter vector/weights.

$$\mathbb{E}[Y_i] = \beta_0 + \beta_1 x_i = \frac{\text{linear combination of unknowns } \beta_0 \text{ and } \beta_1}{\text{with known coefficient 1 and } x_i.}$$

Linear Model in Matrix-Vector Form

$$\mathbf{Y} = \begin{bmatrix} Y_1 \\ \vdots \\ Y_n \end{bmatrix}_{n \times 1}, \quad \mathbf{X} = \begin{bmatrix} 1 & x_1 \\ \vdots & \vdots \\ 1 & x_n \end{bmatrix}_{n \times 2}, \quad \boldsymbol{\beta} = \begin{bmatrix} \beta_0 \\ \beta_1 \end{bmatrix}_{2 \times 1}, \quad \mathbf{e} = \begin{bmatrix} e_1 \\ \vdots \\ e_n \end{bmatrix}_{n \times 1}$$

$$\mathbf{Y} = \mathbf{X}\boldsymbol{\beta} + \mathbf{e}$$
 "Matrix-vector form" data matrix

Linear Model with Multiple Predictors / Features

Multiple (Linear) Regression Model:

$$Y_i = \sum_{j=1}^p x_{ij}\beta_j + e_i, \quad i = 1, \dots, n.$$
$$\mathbf{Y}_{n \times 1} = \mathbf{X}_{n \times p}\boldsymbol{\beta}_{p \times 1} + \mathbf{e}_{n \times 1}$$

vector of random elements

Linear Regression Example

$$Y_i = \beta_0 + \beta_1 x_{i_1} + \beta_2 x_{i_2} + e_i, \quad i = 1, \dots, 50$$

 Y_i : grade

 x_{i2} : time spent on review

$$\begin{array}{ll} Y_i: \text{ grade} \\ x_{i1}: \text{ time spent on hw} \\ x_{i2}: \text{ time spent on review} \end{array} \left[\begin{array}{c} Y_1 \\ \vdots \\ Y_{50} \end{array} \right] = \left[\begin{array}{ccc} 1 & x_{11} & x_{12} \\ \vdots & \vdots & \vdots \\ 1 & x_{50,1} & x_{50,2} \end{array} \right] \left[\begin{array}{c} \beta_0 \\ \beta_1 \\ \beta_2 \end{array} \right] + \left[\begin{array}{c} e_1 \\ \vdots \\ e_{50} \end{array} \right]$$

How to estimate model parameters β_0, β_1 , and β_2 ? Least-Squares!

Least-Squares for Parameter Estimation

Problem Setup: $\mathbf{Y} = \mathbf{X}\boldsymbol{\beta} + \mathbf{e}$, where $\mathbf{X} \triangleq [\boldsymbol{\xi}_1, \dots, \boldsymbol{\xi}_p]$.

Estimate β such that $J(\beta) = \|\mathbf{Y} - \mathbf{X}\beta\|^2$ is minimized.

or
$$J(\beta) = \sum_{i=1}^{n} (Y_i - \sum_{j=1}^{p} x_{ij}\beta_j)^2$$

This is called "least-squares."

Least-Squares via Vector Calculus

Method 1:
$$\nabla_{\beta}J(\beta) = \begin{vmatrix} 0 \\ \beta = \hat{\beta} \end{vmatrix}$$

Recall:
$$J(\boldsymbol{\beta}) = \|\mathbf{Y} - \mathbf{X}\boldsymbol{\beta}\|^2$$

$$\nabla_{\boldsymbol{\beta}} J(\boldsymbol{\beta}) = 2 \left[-\mathbf{X}^T (\mathbf{Y} - \mathbf{X}\boldsymbol{\beta}) \right] = \begin{vmatrix} \mathbf{0} \\ \boldsymbol{\beta} = \hat{\boldsymbol{\beta}} \end{vmatrix}$$

$$\mathbf{X}^T\mathbf{Y} = \mathbf{X}^T\mathbf{X}\hat{\boldsymbol{\beta}}$$

$$\mathbf{X}^T(\mathbf{Y} - \mathbf{X}\hat{\boldsymbol{eta}}) = \mathbf{0}$$

(Error orthogonal to data)

Normal Equation (N.E.)

Least-Squares via Partial Differentiation (optional)

If linear algebra is not used, the derivation can be much more involved:

Method 2:

$$\frac{\partial J}{\partial \beta_k} = \sum_{i=1}^n 2(Y_i - \sum_{j=1}^p x_{ij}\beta_j) \underbrace{\frac{\partial}{\partial \beta_k} \Big(- \big(\dots + x_{ik}\beta_k + \dots \big) \Big)}_{-x_{ik}}$$

$$= |_{\beta_i = \hat{\beta}_i} 0, \quad k = 1, \dots, p$$

$$\iff \sum_{i} Y_{i} x_{ik} = \sum_{i} \sum_{j} x_{ij} \hat{\beta}_{j} x_{ik} \iff \mathbf{X}^{T} \mathbf{Y} = \mathbf{X}^{T} \mathbf{X} \hat{\boldsymbol{\beta}} \text{ Normal Equation (N.E.)}$$

$$\hat{\boldsymbol{\beta}} = (\mathbf{X}^{T} \mathbf{X})^{-1} \mathbf{X}^{T} \mathbf{Y}$$
where $\mathbf{X}^{T} \mathbf{Y} = \left[\sum_{i=1}^{n} x_{ik} Y_{i}\right]_{n \times 1}, \ \mathbf{X}^{T} \mathbf{X} = \left[\sum_{i=1}^{n} x_{ij} x_{ik}\right]_{n \times n}$

$$\mathbf{X}^T \mathbf{X} \hat{\boldsymbol{\beta}} = \left[\sum_{j=1}^p \left(\sum_{i=1}^n x_{ij} x_{ik} \right) \hat{\beta}_j \right]_{p \times 1}$$

Recall: $J(\boldsymbol{\beta}) = \sum_{i=1}^{n} \left(Y_i - \sum_{j=1}^{p} x_{ij} \beta_j \right)^2$

Geometric Interpretation of Least-Squares (LS)

- ◆ The LS procedure finds a vector $\widehat{\beta}$ in the column (vector) space of X, i.e., $C(X) = \{Xb, b \in \mathbb{R}^p\}$ such that
 - $+ \widehat{Y} = X\widehat{\beta}$ is as close as possible to y, or
 - + $(Y \widehat{Y}) \perp C(X)$.

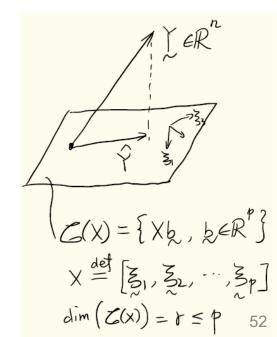

$$(\mathbf{Y} - \hat{\mathbf{Y}}) \perp \mathcal{C}(\mathbf{X})$$

$$\iff (\mathbf{Y} - \hat{\mathbf{Y}}) \perp \mathbf{X}\mathbf{b}, \quad \forall \mathbf{b} \in \mathbb{R}^{p}$$

$$\iff \boldsymbol{\xi}_{j}^{T}(\mathbf{Y} - \hat{\mathbf{Y}}) = 0, \quad j = 1, \cdots, p$$

$$\iff [\boldsymbol{\xi}_{1}, \dots, \boldsymbol{\xi}_{p}]^{T}(\mathbf{Y} - \mathbf{X}\hat{\boldsymbol{\beta}}) = \mathbf{0}$$

$$\iff \mathbf{X}^{T}\mathbf{Y} = \mathbf{X}^{T}\mathbf{X}\hat{\boldsymbol{\beta}}$$

Properties of Least-Square Estimate

If $rank(\mathbf{X}) \triangleq r = p$ $\hat{\boldsymbol{\beta}} = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{Y}$ is unique soluntion.

$$\mathbb{E}[\hat{\boldsymbol{\beta}}] = \mathbb{E}[(\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{Y}] = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T (\mathbf{X} \boldsymbol{\beta}) = \boldsymbol{\beta} \text{ (unbiased)}$$

②
$$\hat{\mathbf{Y}} = \mathbf{X}\hat{\boldsymbol{\beta}} = \mathbf{X}(\mathbf{X}^T\mathbf{X})^{-1}\mathbf{X}^T\mathbf{Y} = \mathbf{H}\mathbf{Y}$$

$$\mathbf{H} : \text{"hat" matrix, or "orthogonal projector."} \quad \mathbf{H}^n = \mathbf{H}. \text{ Why?}$$

Ex: Linear Model for Learning and Prediction

- ◆ Training data (3 data points / a random sample of size 3):
 - → Feature/predictor 1: (2, 1, 1). Feature/predictor 2: (1, 2, 1).
 - **→** Labels: (1, 1, 1).
- ◆ Test data (2 data points / a random sample of size 2):
 - → Feature 1: (1.2, 1.8). Feature 2: (0.9, 1.3).
 - **→** Labels: (0.9, 0.8).
- ♦ Tasks:
 - a) Learn a linear model without intercept.
 - b) Using drawing to illustrate the data and learned model.
 - c) Evaluate the mean squared errors (MSEs) of training and testing.

a)
$$\mathbf{X} = \begin{bmatrix} 2 & 1 \\ 1 & 2 \\ 1 & 1 \end{bmatrix}$$
 $\mathbf{Y} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$ $\mathbf{Y} = \mathbf{X}\boldsymbol{\beta} + \mathbf{e}$ (\mathbf{X}, \mathbf{Y})

Estimated/
trained model $\hat{\boldsymbol{\beta}} = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{Y}$

parameters:
$$= \left(\begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \end{bmatrix} \begin{bmatrix} 2 & 1 \\ 1 & 2 \\ 1 & 1 \end{bmatrix} \right)^{-1} \left(\begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \right)$$

$$= \begin{bmatrix} 6 & 5 \\ 5 & 6 \end{bmatrix}^{-1} \begin{bmatrix} 4 \\ 4 \end{bmatrix} = \begin{bmatrix} 6 & -5 \\ -5 & 6 \end{bmatrix} \cdot \frac{1}{11} \cdot \begin{bmatrix} 4 \\ 4 \end{bmatrix}$$

$$\begin{bmatrix} 1 \\ 1 \end{bmatrix}$$
 $\mathbf{Y} = \mathbf{X}\boldsymbol{\beta} + \mathbf{e}$ $(\mathbf{X}, \mathbf{Y}) : \begin{array}{c} \text{training} \\ \text{data} \end{array}$ $\mathbf{X}^T \mathbf{Y}$ $\begin{bmatrix} \mathbf{b} \end{bmatrix}$ $\begin{bmatrix} \mathbf{x} & \mathbf{y} & \mathbf{y} \\ \mathbf{y} & \mathbf{y} \end{bmatrix}$ $\begin{bmatrix} \mathbf{y} & \mathbf{y} & \mathbf{y} \\ \mathbf{y} & \mathbf{y} \end{bmatrix}$

 $C(x) = span \{ \begin{bmatrix} 2 \\ 1 \end{bmatrix}, \begin{bmatrix} 2 \\ 2 \end{bmatrix} \} \subset \mathbb{R}^3$

Predicted output based on training data:

$$\hat{\mathbf{Y}} = \mathbf{X}\hat{\boldsymbol{\beta}} = \begin{bmatrix} 2 & 1\\ 1 & 2\\ 1 & 1 \end{bmatrix} \xrightarrow{\frac{4}{11}} \begin{bmatrix} 1\\ 1 \end{bmatrix} = \frac{1}{11} \begin{bmatrix} 12\\ 12\\ 8 \end{bmatrix} \neq \mathbf{Y}, \text{ or } \mathbf{\hat{Y}} = \mathbf{H}\mathbf{Y} = \frac{1}{11} \begin{bmatrix} 12\\ 12\\ 12\\ 8 \end{bmatrix}$$

$$\hat{\mathbf{Y}} = \mathbf{H}\mathbf{Y} = \frac{1}{11} \begin{bmatrix} 12\\ 12\\ 12\\ 8 \end{bmatrix}$$

$$55$$

NC STATE UNIVERSITY

$$\frac{1}{3} \sum_{i=1}^{3} \left(y_i - \mathbf{x}_i^T \hat{\boldsymbol{\beta}} \right)^2 = \frac{1}{3} \| \mathbf{Y} - \hat{\mathbf{Y}} \|^2 = \frac{1}{3} \| \mathbf{Y} - \mathbf{X} \hat{\boldsymbol{\beta}} \|^2$$

$$= \frac{1}{3} \cdot \frac{1}{11^2} \left\| \begin{bmatrix} 12 - 11 \\ 12 - 11 \\ 8 - 11 \end{bmatrix} \right\|^2 = \frac{1}{3} \cdot \frac{1}{11^2} (1 + 1 + 9) = \frac{1}{3} \cdot \frac{1}{11} = 0.03$$

Convolutional Neural Network (CNN)

Learning objectives

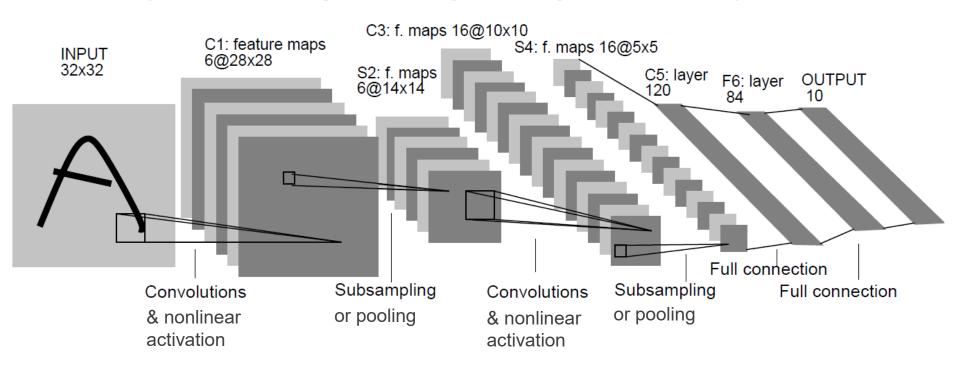

- Describe the structure of CNN
- Build and train simple CNNs using a deep learning package

(Ref: Ch 9 of Goodfellow et al. 2016)

Some slides were adapted from Stanford's CS23 In by Fei-Fei Li et al.: http://cs23 In.stanford.edu/

Convolutional Neural Network (CNN)

The **single** most important technology that fueled the rapid development of **deep learning** and **big data** in the past decade.

LeCun, Bottou, Bengio, Haffner, "Gradient-Based Learning Applied to Document Recognition," *Proc. IEEE*, 1998.

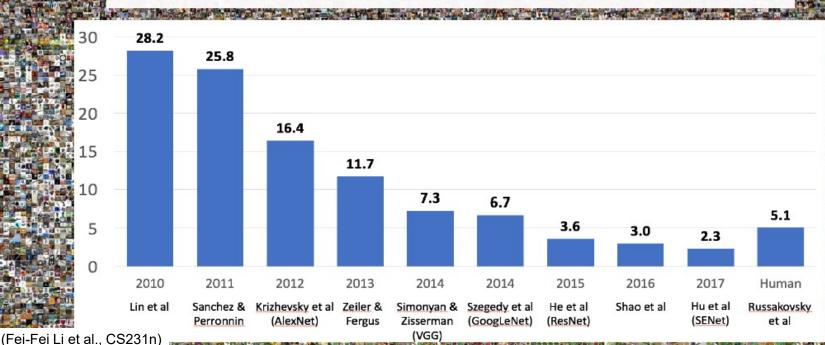

Why is Deep Learning so Successful?

- I. Improved model: convolutional layer, more layers ("deep"), simpler activation (i.e., ReLU), skip/residual connection (i.e., ResNet), attention (i.e., Transformer)
- 2. Big data: huge dataset, transfer learning
- **3. Powerful computation:** graphical processing units (GPUs)
- Example of big data: ImageNet (22K categories, 15M images)

IM ... GENET Large Scale Visual Recognition Challenge

The Image Classification Challenge: 1,000 object classes 1,431,167 images

Linear Model to Neural Network

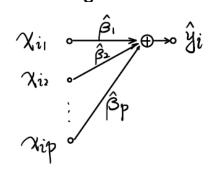

Recall linear model w/ multiple predictors / features / inputs.

$$\frac{y_i}{y_i} = \sum_{j=1}^{p} x_{ij} \beta_j + e_i = \begin{bmatrix} \beta_1, ..., \beta_p \end{bmatrix} \begin{bmatrix} x_{i1} \\ x_{ip} \end{bmatrix} + e_i, \quad i=1,..., n.$$
true output $\hat{\beta}_i = \sum_{j=1}^{p} x_{ij} \beta_j = \begin{bmatrix} \hat{\beta}_1, ..., \hat{\beta}_p \end{bmatrix} \begin{bmatrix} x_{i1} \\ x_{ip} \end{bmatrix}$

$$= \begin{bmatrix} \hat{\beta}_1, ..., \hat{\beta}_p \end{bmatrix} \begin{bmatrix} x_{i1} \\ x_{ip} \end{bmatrix}$$
predicted output

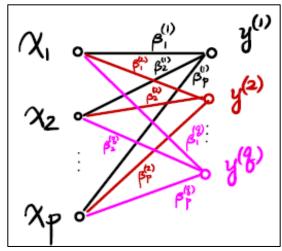

extimated

Graphically we have:

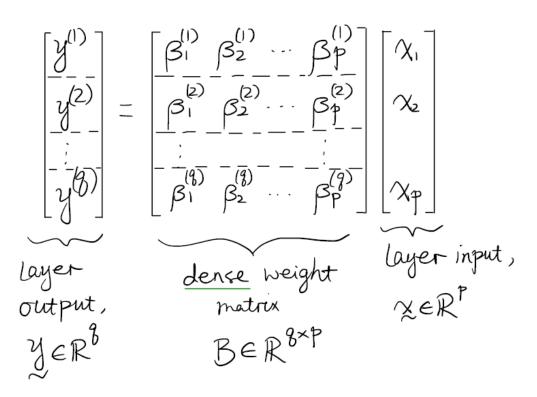

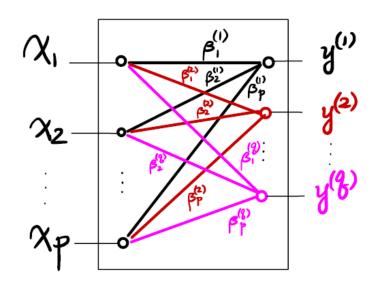

(1) Use multiple linear models

2 Simplify the notations.

One Last Thing: When Output is Categorical

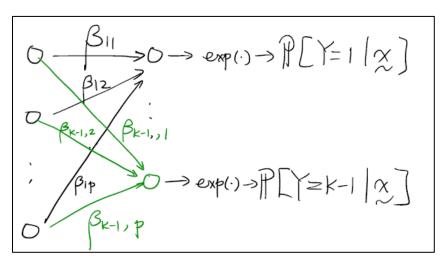

- ◆ A **softmax layer** is needed:
- Softmax function:

$$O_i(z) = \frac{e^{\beta z_i}}{\sum_{j=1}^{k} e^{\beta z_j}}$$

♦ Ex:

$$K=2$$
 $\sigma_{1} = \frac{e^{\beta z_{1}}}{e^{\beta z_{1}} + e^{\beta z_{2}}}$

$$= \frac{1}{1 + e^{\beta (z_{2} - z_{1})}}$$

When
$$\beta$$
 very large, $Z_2 > Z_1$ leads to $\begin{cases} O_1 = 0 \\ O_2 = 1 \end{cases}$

Winner takes all!
